Nearly three percent of the world's have the symptoms of psoriasis. There is constant pain from cracking and bleeding skin, continually shedding scales that litter their clothes and surroundings. They struggle with the disappointment of treatments and the lack of a cure. A few of them have arthritis. The most painful experience of public rejection because of the misunderstanding surrounding the skin disease.

Psoriasis is a chronic, autoimmune disease that appears on the skin. It occurs when the immune system sends out faulty signals that speed up the growth cycle of skin cells. Psoriasis is not contagious. Psoriasis usually begins in scalp. There itching and scaling in the form of dandruff. It mistaken as common dandruff and treated by shampoos and lotions. But it is only temporarily relieved and come back again. When psoriasis extends beyond scalp and appears behind ears, it is early sign of psoriasis to differentiate from common dandruff. But if this is also ignored then it extends to other parts of body like elbows, and knees etc. The skin on elbows and knees becomes thick with sever itching and scaling. Then it confirmed to be psoriasis.

Some parients of psoriasis experience an inflammatory polyarthritis (psoriatic arthritis) with swelling of finger joints and toes. Psoriasis and psoriatic arthritis cause major physical, functional and psychosocial disability.

. Special types include nail psoriasis, pustular psoriasis (localized to palms and soles, or generalized), psoriatic erythroderma, inverse psoriasis and various forms of palmo-plantar involvement.

Psoriasis affects two to three percent of the world's population. It can develop in males or females of any ethnicity or age. It often appears between the ages of 15 and 35, although it can strike at any age including infants and the elderly.

The exact causes of psoriasis have not yet known, but it has been confirmed that it is related to the body's immune system and that it has a hereditary predisposition. In people with psoriasis, the immune system is mistakenly "triggered" causing skin cells to grow too fast. The rapidly growing cells pile up in the skin's top layers, leading to the formation of lesions on the surface.
One cannot catch psoriasis from someone else.

People fear the lesions might be contagious, but they are not, or that the person who has psoriasis is unclean or the person who has the condition did something to cause psoriasis to appear but that, too, is false.

Psoriasis is a chronic condition that most often requires lifelong treatment. And because there are so many different medications and treatment options, and no person is alike another, it may take some time before the right treatment or combination of treatments will work for an individual. Sometimes psoriasis becomes worse (called a flare) than at other times. In some cases, psoriasis can go away on its own for a period of time, which is known as a "spontaneous remission."

Homeopathy offers an safe and effective treatment of psoriasis.

Successful Homeopathic treatment: - Psoriasis when normally treated by external ointments and strong chemicals it seems to disappear for time being. But soon reappear with more intensity and on larger areas. Psoriasis is not just skin disorder but a sign of deep rooted problem. And an exterior manifestation of deeper ailments.

Psoriasis is result of defective immune system. Homeopathic medicines restore the disordered immune system to its healthy state prior to psoriasis. Homoeopathic medicines correct the underlying dysfunction of immune system and relieve the disease symptom for years and sometimes permanently.

Homoeopathy offers a therapeutic alternative that is natural, safe, and effective. Homeopathic medicines are safe for children, pregnant women and old people.

Psoriatreat is doing research and homeopathic treatment of psoriasis since 27 years. Thousands of patients all over India and many countries of the world are taking treatment and are benefitted.
